

## Setup/Installation Instructions

To setup the software for use, you will need to config the server.props and db.props files to suit your network and database configuration. To configure the db.props file, open it using a text editor. In the file there will be three lines you may not to change, the first one is the first line where it says *'jdbc.url=jdbc:mariadb//localhost:3306'*, the text after the equals sign is the URL of the database you wish to use, change this to the URL of your database. The second change will be on the third line where it says *'jdbc.username=root'*, the text after the equals sign is the username for your database and you may need to change it. The last change is the last line where is says *'jdbc.password=pass'*, the text after the equals sign is the databases password and you may need to change it to suit your database.

For setup you may also have to change the server.props files, there are three of these files. One located in the 'viewer' directory, another in the 'server' directory and one in the 'control panel' directory. In each of these files, you will need to ensure that the URL and port number in these files are corresponding to the URL and port number that you sever is hosted on.

## Default User

The software comes with a default administration account that can be used as soon as the software is launched. The username and password for this account are:

**Username:** admin

**Password:** password

## Database

You will need to have a database called billboarddatabase for the software to work.
